

Business Continuity Center

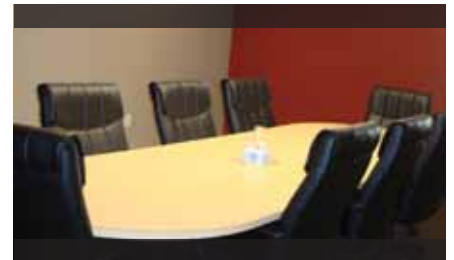

The C9D Business Continuity Center features a world-class, below-grade Data Center built to Tier III specifications, located securely outside of major metropolitan areas. The Business Continuity Center offers a colocated Network Operations Center (NOC) in addition to leasable, turn-key office and conference space with up to 100 Business Continuity Seats available, ideal for Business Continuity necessities or periods of business expansion.

Constructed with reinforced concrete and a high strength, cantilevered concrete cap, ensuring the physical integrity of the building through any natural or man-made disaster, the C9D Data Center facilities are both waterproof and fireproof. A raised floor area with a static dissipative structure protects the systems, and most importantly, the data. In addition to the physical construction, the Data Center supplies conditioned power with modular battery back-up, supplemented with a back-up diesel generator, guaranteeing the systems are available when you need them most.

The C9D Data Center employs the latest technologies available for IT infrastructure, IT security, as well as physical security. The C9D Data Center implements physical and electronic controls with auditable security access, inventory, and data control. The infrastructure leverages a series of layers, ensuring multiple paths of redundancy, including various ingress/egress paths and tiered providers.

Offering a portfolio of Virtual Hosting, Cloud Services, Colocation, and Archival & Management Data Storage, our goal at C9D is to provide a Business Continuity service solution optimized for meeting your needs, yet flexible enough to move with changing business conditions.
